Have you had an ECT consultation?

Will you be starting ECT at UCLA?

Have you been experiencing a treatment resistant, major depressive episode for at least the past 6 months?

Are you between 20-65 years old?

- If so, you may be eligible to participate in a study that is looking at how the brain responds to ECT treatment.

- The study involves 2 visits to our laboratory, including 2 brain scans (1 before you start ECT, and 1 at the end of your treatment series). You will also be asked to complete a number of questionnaires and perform tests of memory and thinking.

- The study also involves blood draws at each visit, as well as logging weekly mood on your phone during your treatment series.

- Participants can earn up to $295 for completing all appointments.

Please call 310-825-4163 or e-mail DGCBiomarkerStudy@mednet.ucla.edu and ask to speak to the ECT Study Coordinator.
